Servicenow

IT ServiceNow Scenario

- Laptop Issue - Employee & Company Flow

Scenario

- Ahmed (Employee) cannot connect his laptop to the internet.
- He reports the issue to IT Support.

Step 1: Create Incident (New)

- Caller: Ahmed
- Category: Network
- Short Description: Laptop not connecting
- State: New

Step 2: Assign Incident

- Assign to IT Support
- Assigned To: IT Agent
- State changes to In Progress

Step 3: On Hold

- IT asks for more info
- State: On Hold
- Reason: Awaiting Caller

Step 4: Caller Reply

- Ahmed replies with details
- State returns to In Progress

Step 5: Problem Creation

- Multiple employees report same issue
- Create Problem
- Link all incidents

Step 6: Change Request

- Root cause: Network driver issue
- Create Change Request
- Update system safely

Step 7: Resolve & Close

- Fix applied
- Incident → Resolved → Closed
- Problem & Change closed

SLA

- Resolve within defined time
- On Hold pauses SLA timer

Final Flow

- New → In Progress → On Hold → In Progress → Problem → Change → Closed

Student Practice

🍽️ Restaurant Incident Story

- It was a busy Friday night at *Golden Fork Restaurant*. The restaurant was full, and customers were continuously placing orders.
- Ahmed, a waiter, was using the restaurant system to send orders to the kitchen. Suddenly, he noticed something strange — the orders were not appearing on the kitchen screen.
- At first, Ahmed thought it was just a small delay. But after trying multiple times, he realized that none of the orders were going through. The kitchen staff started complaining that they were not receiving any new orders.
- Ahmed immediately reported the issue in the system:
- **Short Description:** "Orders are not reaching the kitchen display system."
- The issue was logged, and the status was set to **New**.

🍽️ Restaurant Incident Story

- After a few minutes, the IT support team of the restaurant was assigned to the issue. Once the issue was assigned, the status automatically changed to **In Progress**.
- The support team started investigating, but they needed more information. They contacted Ahmed and asked:
- When did the issue start?
- Is it happening for all orders or just specific ones?
- Since they were waiting for Ahmed's response, they changed the status to **On Hold** with the reason **Awaiting Caller**.

🍽️ Restaurant Incident Story

- Ahmed checked and replied:
- "The issue started about 10 minutes ago, and it's affecting all orders."
- Once Ahmed responded, the system automatically changed the status back to **In Progress**, and the team continued working on the issue.
- Meanwhile, other waiters (Sara and Mahmoud) reported the same issue. Multiple incidents were now being raised for the same problem.
- The IT team realized this was not a single issue anymore — it was affecting the whole restaurant.
- So, they created a **Problem** record and linked all related incidents to it.

🍽️ Restaurant Incident Story

- After deeper investigation, the team discovered that the issue was caused by a failure in the main order server. Fixing it required restarting and updating the system.
- Since this action could impact the restaurant operations, they created a **Change Request** to safely perform the fix.
- Once the change was approved and implemented, the system started working again. Orders were successfully reaching the kitchen.
- The **Problem** was marked as resolved, and all related **Incidents** were automatically closed.
- At the end, the restaurant manager reviewed the **SLA** and confirmed that the issue was resolved within the acceptable time.
- Everything returned to normal, and the restaurant continued serving customers smoothly.

🍽️ Other Scenarios

- 1.Auto detect repeated incidents for 3 min the same description for 3 incidents with same issue create problem and Link all incidents to it.
- 2.Auto detect repeated incidents If 2 incidents with same issue and same callerShow error message

Thank you
