SN Utils Cheat Sheet (Slash Commands)

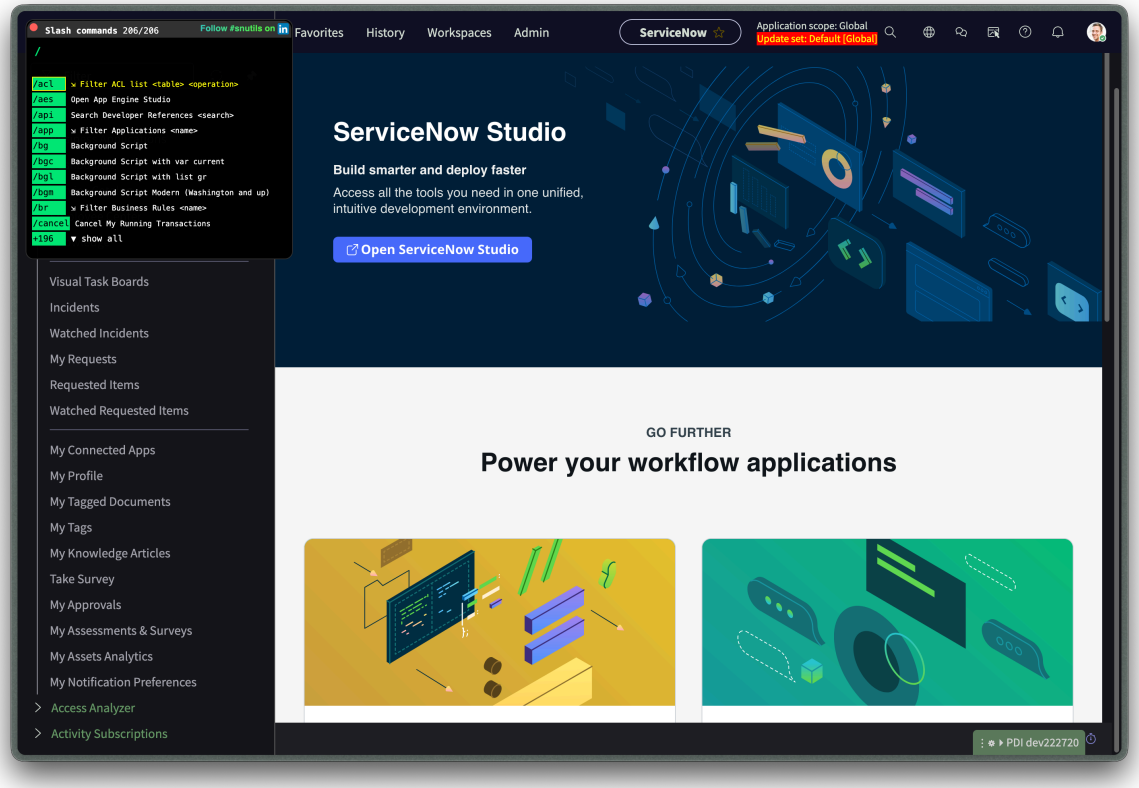
By: Youssef Alsafrani

1. Open the Command Window

To start using SN Utils commands:

- Ctrl + /

This opens the SN Utils command palette where you can type slash commands.



2. Open Any Table Quickly

Instead of navigating through menus:

```
/tablename
```

Examples:

```
/incident
/problem
/sys_user
```

This opens the table instantly in list view.

---

3. Search for a Table (Wildcard)

If you don't remember the exact table name:

```
/*partial-name
```

Examples:

```
/*user
/*script
/*group
```

This searches for any table that contains the keyword.

---

4. Create a New Record

To open a new record form directly:

```
/tablename -n
```

Example:

```
/incident -n
```

This opens a **new incident form** without going through the UI.

---

5. Open a Random Record

To open any random record from a table:

```
/tablename -r
```

Example:

```
/incident -r
```

Useful for testing, debugging, or exploring data.

---

6. Filter Records (Example: Active Incidents)

You can apply filters using switches like -a:

```
/tablename -a
```

Example:

```
/incident -a
```

This shows **only active records** in the table.

---

7. Show Technical Names

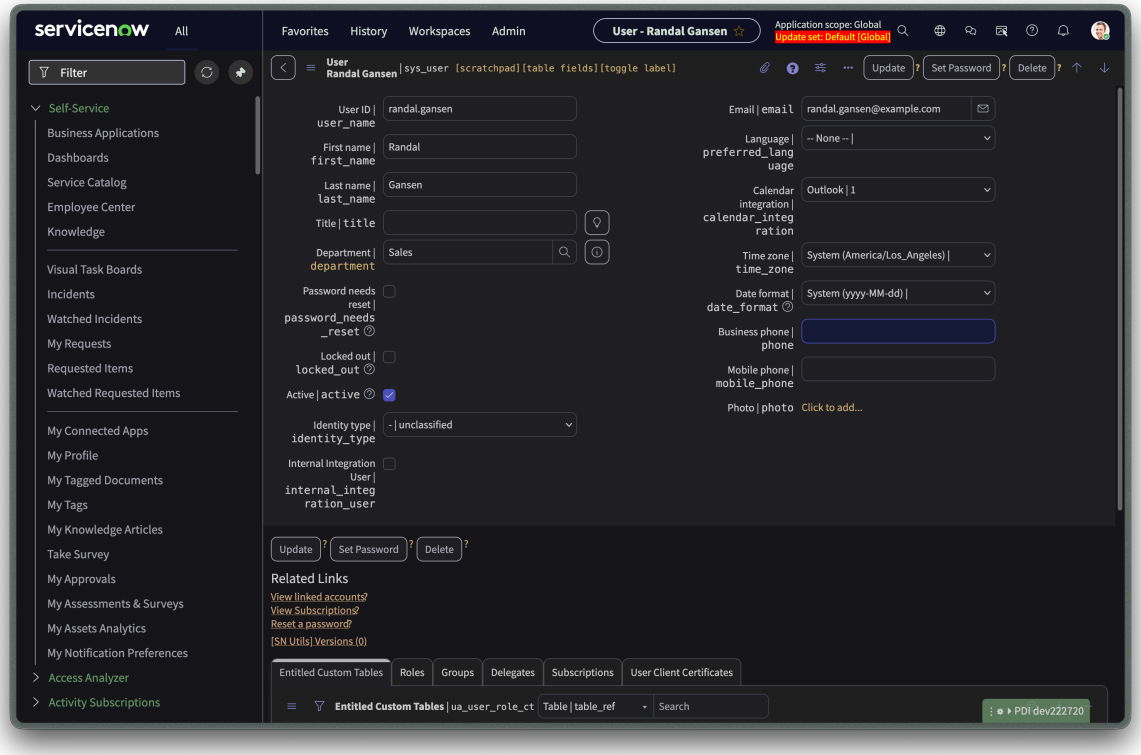
To toggle technical names (very useful for developers):

```
/tn
```

This shows:

- Field names
- Table names
- Useful for scripting and debugging

Example with TN activated:



Summary (Quick Reference)

```
Ctrl + /        → Open SN Utils
/incident       → Open Incident table
/*user          → Search tables
/incident -n    → New record
/incident -r    → Random record
/incident -a    → Active records only
/tn             → Toggle technical names
```
