Servicenow

ServiceNow Session Summary & Scenario Questions

GlideDateTime, GlideRecord, Background Scripts, Fixed Scripts & Advanced Concepts

1. GlideDateTime API

- Working with date and time in ServiceNow
- Using server time vs local user time
- Important methods: getValue(), getDisplayValue()

2. Add / Subtract Date & Time

- Adding days, weeks, hours, minutes, and seconds
- Using addDaysLocalTime(), addWeeksLocalTime(), addSeconds()
- Using negative values for subtraction

3. Incident Due Date Automation

- Auto-setting due dates based on priority or next Monday
- Using scripts to automate SLAs and deadlines

4. Convert String to GlideDateTime

- Converting text date into GlideDateTime object
- Needed before inserting into date/time fields

5. Compare Two Dates

- Using GlideDateTime.subtract()
- Converting milliseconds into hours/days

6. Week Number & Next Monday

- Using getWeekOfYearUTC()
- Finding next Monday using getDayOfWeekUTC()

7. Background Scripts

- Used for quick testing and temporary execution
- Execution history is temporary

8. Fixed Scripts

- Safer for production environments
- Reusable and can be transported between environments

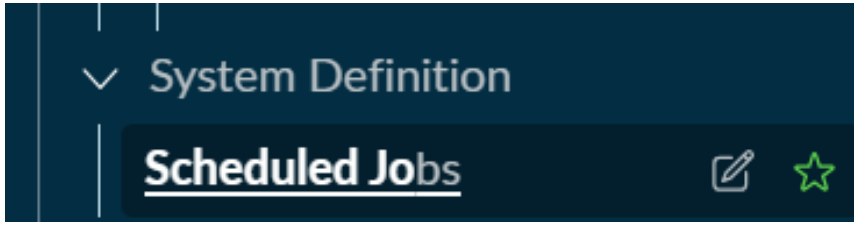
9. Table Cleanup

- Automatically deleting old records
- Useful for incidents, logs, and archived data

- **Scenario 1 — Auto Escalate Customer Case After 48 Hours**
- **Use Case**
- If a customer case stays in "New" state for more than 48 hours, automatically escalate it to Tier 2 support.
- **Business Rule (Scheduled Job or Before Update)**

- **Scenario 2 — Set SLA Due Date Based on Customer Priority**
- **Use Case**
- When a customer creates a case:
- High Priority → due in 4 hours
- Medium Priority → due in 1 day
- Low Priority → due in 3 days

- **Scenario 3 — Send Reminder Before Case Follow-Up Meeting**
- **Use Case**
- Customer requested a follow-up call.
  System should send reminder email 30 minutes before appointment time.



- **1 — Auto Close Resolved Incidents After 3 Days (ITSM)**
- **Use Case**
- If incident state is "Resolved" for more than 3 days, auto close it.
- Scheduled Job Script

- **2 — Reopen Case if Customer Replies Within 7 Days (CSM)**
- **Use Case**
- Customer case is closed.
  If customer sends email reply within 7 days, reopen case automatically.

- **2 — Reopen Case if Customer Replies Within 7 Days (CSM)**
- **Use Case**
- Customer case is closed.
  If customer sends email reply within 7 days, reopen case automatically.

- **3 — Detect SLA Breach Before It Happens (ITSM)**
- **Use Case**
- Notify assignment group 15 minutes before SLA breach.

- **4 — Escalate VIP Customer Cases at Night (CSM)**
- **Use Case**
- If VIP customer creates high priority case outside business hours, escalate immediately.

- **5 — Calculate Waiting Time for Customer Response (CSM)**
- **Use Case**
- Track how long support waited for customer reply.
- **Script Include / BR**

- **6 — Detect Long Pending Incidents (ITSM)**
- **Use Case**
- Find incidents stuck in "On Hold" more than 24 hours.
- **Scheduled Script**

- **7 — Prevent Agent from Closing Case Too Quickly (CSM)**
- **Use Case**
- Prevent closing case before minimum investigation time (10 minutes).
- **Before Update Business Rule**

Management System Scenario Questions

- Create a Management System scenario where employee tasks automatically get a due date based on the next Monday after creation.
- In a Management System, compare two employee contract dates and calculate the difference in working hours.

Management System Scenario Questions

- Write a scenario where a manager uses Background Script to update 500 employee records temporarily.
- Create a Fixed Script scenario to update missing department categories every year.

Management System Scenario Questions

- Build a Management System use case where old audit records are deleted automatically after 3 years.

Management System Scenario Questions (Advanced)

- Create a scenario where different office branches display different local times using GlideDateTime.
- Write a script scenario where the HR system converts a string joining date into a valid date field.

Management System Scenario Questions (Advanced)

- Design a Management dashboard requirement that uses week numbers for monthly planning reports.
- Create a Management System requirement combining GlideRecord and While Loop to update task priorities.

Management System Scenario Questions (Advanced)

- Build an approval workflow scenario where due dates change dynamically based on employee role priority.

Restaurant Scenario Questions

- Create a Restaurant Management scenario where reservation deadlines automatically move to the next Monday.
- Compare two restaurant booking dates and calculate customer waiting time in hours.

Restaurant Scenario Questions

- Write a Background Script scenario to update missing menu categories for all dishes.
- Create a Fixed Script use case to update all restaurant branches with new tax rules.

Restaurant Scenario Questions

- Build a restaurant cleanup scenario where canceled reservations older than 2 years are deleted automatically.

Restaurant Scenario Questions (Advanced)

- Create a scenario where restaurant branches in different countries display local delivery times.
- Write a script to convert a string delivery date into GlideDateTime before saving it.

Restaurant Scenario Questions (Advanced)

- Design a restaurant weekly sales report using getWeekOfYearUTC().
- Create a Restaurant Management workflow combining GlideRecord, loops, and due date automation.

Restaurant Scenario Questions (Advanced)

- Build a customer complaint system scenario where high-priority complaints get due dates within 24 hours.

Study Notes

- Focus Areas:
- GlideDateTime
- GlideRecord
- Background Script vs Fixed Script
- Date Calculations
- Loops & Conditions
- Incident / Task Automation
- Real Production Best Practices

Thank you
