Simplifying Data Selection with Tree Picker

What is a Tree Picker?

It's a UI element that allows users to navigate and select records from a hierarchical structure inside Reference field lookup.

Example

Selecting a company from an organizational hierarchy in an Asset record is a perfect use case for Tree Picker.

Conditions

- Records that have a 'parent' field, where the 'parent' field points back to the same table, f.e. core_company field on core_company record

Name	ACME Americas		
Parent	ACME Corporation		

- Technical Name of the field needs to be 'u_parent' (the OOTB ones have just 'parent')

Creating Parent field

The parent field is already configured for the core_company table 00TB, and this setup is common for many tables.

To implement the same configuration for tables that don't have it, simply create a Reference field with the technical name "u_parent". This field should reference the same table.

* Type	Reference	🔍	ℹ️
* Column label	Parent		
* Column name	u_parent		

Configure the Tree Picker

1. Go to Dictionary of
alm_hardware table
2. Select core_company
Reference field
3. Add "tree_picker=true"
in the Attributes

Attributes

encode_utf8=false, no_audit=true, readonly_clickthrough=true, tree_picker=true

Before

Companies

Name

Search

All > Name contains acme

	Name ▲	Street	City	State / Province
	*acme	Search	Search	Search
●	ACME Africa			
●	ACME Americas			
●	ACME APAC			
●	ACME Australia		Sydney	
●	ACME China		Shanghai	
●	ACME Corporation			

After

Companies

Companies Hierarchy

-  3Com
-  Acer
-   ACME Corporation
 -  ACME Africa
 -   ACME Americas
 -  ACME North America
 -  ACME South America
 -   ACME APAC
 -   ACME EMEA

Benefits

Intuitive Navigation

Tree Picker allows users to navigate through complex hierarchical data easily.

Efficient Selection

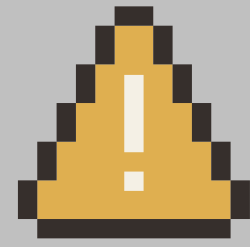

Users can quickly find and select the desired item without scrolling through long lists.

Improved Data Accuracy

Reduces errors by providing a visual representation of the company hierarchy.

Watch out

If you exclude one of the parents
via Reference Qualifier, the
children won't be selectable in
Tree Picker as well!

Conclusion

It's a very useful feature which can be used across the platform. The `core_company` table was just an example. Other ideas for this feature:

★ Product Category selection

★ Location selection

★ Department selection

Thanks,
Krystian
