

Workflow Data Fabric Demo

Transcript

Businesses are storing more data than ever before, but it's often trapped and siloed across hundreds of different systems.

Workflow Data Fabric connects any system or data source directly into the ServiceNow platform, powering all your workflows and AI with real-time data.

Let's see how. What you're seeing is Workflow Data Fabric in action for a large telecommunications company. Enterprises of this size have petabytes of data. To make smart decisions, they need to connect, understand, and act on this data no matter where it resides.

That's where Data Fabric comes in. Here you can see data fabric connecting both structured and unstructured data in Snowflake, Databricks, and even tools like Cisco and hyperscalers like AWS. New with Workflow Data Fabric are zero-copy data partnerships with leading data clouds like Databricks and Snowflake, keeping your critical data where it resides without needing to copy it into ServiceNow.

With just a few clicks, this telco company can set up a new zero-copy connection to their data lake, connecting terabytes of real-time network inventory data directly to ServiceNow. And data fabric's automated record and field-level mapping takes this network inventory data and harmonizes it into a single data model that can be actioned by any workflow in ServiceNow.

After clicking save, this data is now part of the ServiceNow data model.

While the physical data remains external, data fabric zero-copy connections act like any other data in ServiceNow and can be used to build AI workflows or power skills for AI agents all while keeping data where it resides.

Let's see how this works in action.

Here is an AI-powered workflow to monitor network operations. When a critical network outage is detected, the workflow actions a series of tasks to understand the outage and assign a local field service technician.

Before Data Fabric, only top-level network data was stored in ServiceNow. Today, data Fabric brings real-time data from any system directly into this workflow. When a network disruption causes an outage, the workflow has access to a massive data set of real-time IoT device details, tower locations, and relevant articles, triggering a deeper analysis all without leaving ServiceNow.

This data powers not just workflows, but also more accurate and actionable AI here during an outage, an AI agent uses the same data, fabric, connections, and workflows to diagnose the issue, find the right technician, and complete a first-time fix.

The repair is automatically documented and reflected in all data fabric connections. No need to update, move data, or keep multiple systems in sync.

Workflow data, fabric unifies data across your enterprise, powering all your workflows and AI agents with real-time data from any source inside or outside. ServiceNow, all on the single AI platform for business transformation.
